

## More than 30,000 Americans have Williams syndrome The condition occurs in 1 of every 10,000 births worldwide

Students with Williams syndrome have a unique educational profile. Cognitive weakness, especially with visual spatial tasks and abstract reasoning, combined with difficulties with focus often lead to learning challenges for students with Williams syndrome.

But there is good news!

Assistive technology is helping students with Williams syndrome in the classroom. Their ability to access technology combined with the effective utilization of their personal strengths can help improve success with age-appropriate curriculums, in classrooms with their same-age peers.
